Incident report INC-2047: Withdrawal processing stalled

1. Overview

Severity SEV-2. On 2026-03-18 withdrawals stopped being processed from 22:04 UTC until 23:41 UTC, a duration of 97 minutes. 6,870 withdrawal requests were delayed. Deposits were credited to wallets but their ledger entries were written late.

2. Affected services

ledger-service: writes to the ledger_entries table were blocked.

wallet-service: withdrawal requests timed out waiting for ledger writes.

payment-gateway: payouts to PayFlex and CardNova were not initiated while withdrawals were stuck.

3. Cause

The migration in CHG-1047 started at 22:00 UTC and created the index idx_entries_account_created on ledger_entries, a table with about 480 million rows. The index was created without CONCURRENTLY, which takes a lock that blocks writes to the table until the build finishes.

4. Resolution

At 23:30 UTC the index build was cancelled, which released the lock. Withdrawals recovered by 23:41 UTC. The index was rebuilt safely with CREATE INDEX CONCURRENTLY on 2026-03-20 (CHG-1058).
